**DETAILED ACTION**

***Claim Rejections - 35 USC § 102***

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

1. Claim 3 rejected under 35 U.S.C. 102(b) as being anticipated by Ooi

(20020072142).

- a. As to claim 3, Ooi teaches a semiconductor optical device (see paragraph 6) comprising an epitaxial structure of a III-V group semiconductor material (see abstract) , containing at least an active layer which can emit light, wherein composition of the epitaxial structure continuously changes near an interface (see fig. 1b).

- b. As to claim 4, Ooi teaches wherein a photoluminescence wavelength of the optical device is blue-shifted, as compared to a semiconductor optical device which has an active layer with the same composition as said active layer and an epitaxial structure with a composition that changes stepwise near the interface (see abstract) this inherent to to the process of quantum well intermixing (QWI).

- c. As to claim 5, Ooi teaches wherein the photoluminescence wavelength is blue-shifted by at least 20 meV (see paragraph 32).

- d. As to claim 6, Ooi teaches wherein distortion of the epitaxial structure is reduced compared to a semiconductor optical device which has an active layer with the same composition as said active layer and an epitaxial structure with a composition changing stepwise near the interface (see eg. fig 10e item 1123).

By applicant own admission this window is known to help reduce distortion (see page 2 of applicant specification).
